## **Ink Jet printing compared to embossed marking**

Today ink jet printing is the state-of-the-art cable marking method used all over the world for marking of most of cable sheath materials.

Embossing is an older technology, which becomes used less and less. It is more expensive than ink jet marking and less flexible.

Regarding readability and stability respectively abrasion resistance ink jet printing is on similar level compared to embossed marking. No constraints compared to embossed marking must be made.

Use in the field is easily possible with both marking types.
